- 4. A car and a motorcycle are racing from rest. Initially the motorcycle takes the lead, but then the car blows past the motorcycle. The motorcycle first takes the lead because its (constant) acceleration $a_m = 8.40 \text{ m/s}^2$ is greater than the car's (constant) acceleration $a_c = 5.60 \text{ m/s}^2$, but it soon loses to the car because it reaches its greatest speed $v_m = 58.8 \text{ m/s}$ before the car reaches its greatest speed $v_e = 106 \text{ m/s}$. How long does the car take to reach the motorcycle?
 - Calculate the motorcycle's time t_{m1} and corresponding x_{m1} when reaching greatest speed.
 - Calculate the car's displacement x_{c1} and speed v_{c1} after t_{m1} .
 - Suppose they encounter before the car reaches the highest speed.
 - Calculate the rest displacement x_{c2} and x_{m2} before encountering, use the equation $x_{m1} + x_{m2} = x_{c1} + x_{c2}$ and obtain $t_2 = 9.5\text{s}$
 - Final result $t = t_{m1} + t_2 = 16.5\text{s}$

5. Figure shows the following three vectors:

$$\vec{a} = (4.2 \text{ m})\vec{i} - (1.5 \text{ m})\vec{j} \quad \vec{b} = (-1.6 \text{ m})\vec{i} + (2.9 \text{ m})\vec{j} \quad \vec{c} = (-3.7 \text{ m})\vec{j}$$

To add these vectors, find their net x-component and their net y-component. What is

their vector sum $\vec{r}$ which is also shown?

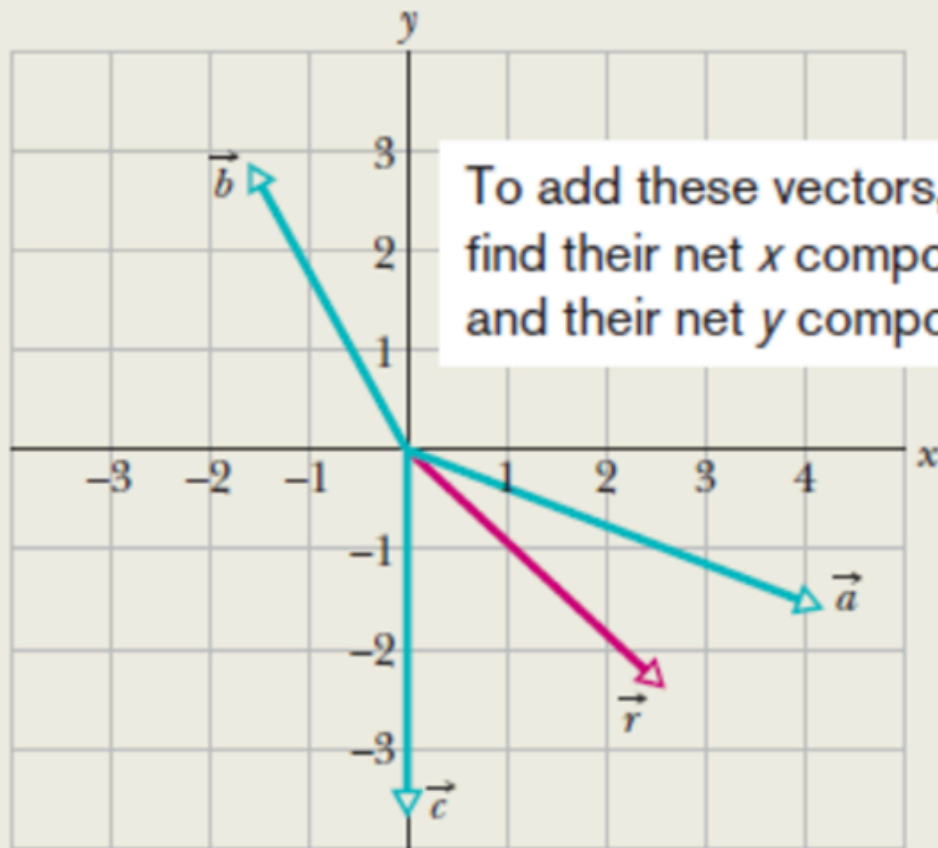

Figure 3-17a shows the following three vectors:

$$\vec{a} = (4.2 \text{ m})\hat{i} - (1.5 \text{ m})\hat{j},$$

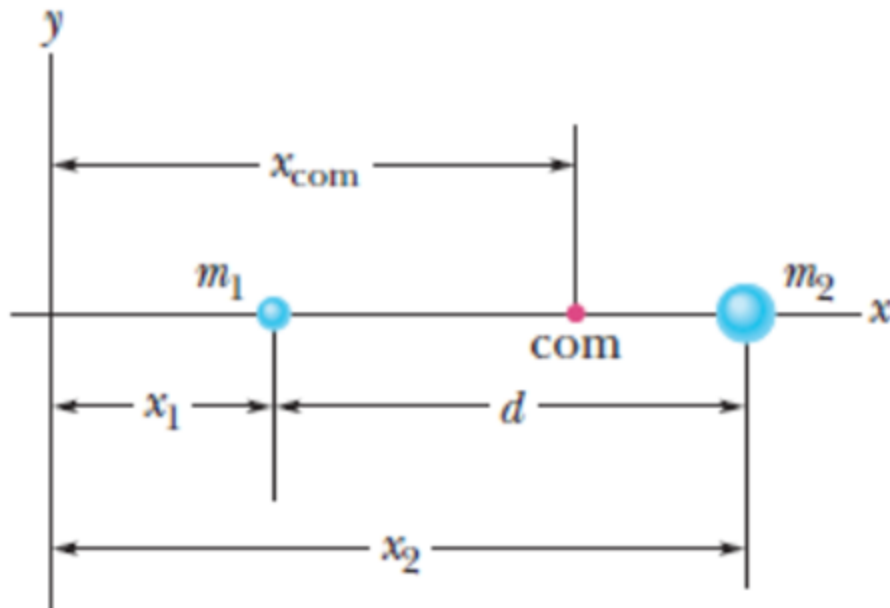

$$\vec{b} = (-1.6 \text{ m})\hat{i} + (2.9 \text{ m})\hat{j},$$

and
$$\vec{c} = (-3.7 \text{ m})\hat{j}.$$

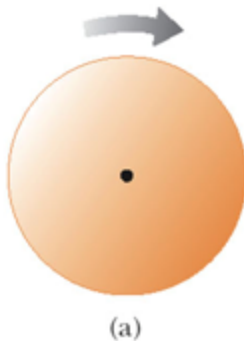

What is their vector sum $\vec{r}$ which is also shown?

- 6. The center of mass of the system made up by the small ball with mass m_1 at x_1 and big ball with mass m_2 at x_2 is ().

- 7. The disk rotates clockwise, the direction of angular velocity is ().

Note the expression that **into the page** or **out of the page**. Here is into the page.

- 8. An object of mass m moves right with speed v . It collides head-on with an object of mass $3m$ moving left with speed $v/3$. If the two stick together to have mass $4m$, what is the speed of the combined object?

Answer: ()

(A) 0 (B) $v/2$ (C) v (D) $2v$

- 9. An 8.00 kg object moving east at 15.0 m/s on a frictionless horizontal surface collides with a 10.0 kg object at rest. After the collision, the 1st object moves South at 4.00 m/s.

Question 1: Find the velocity of the 2nd object.

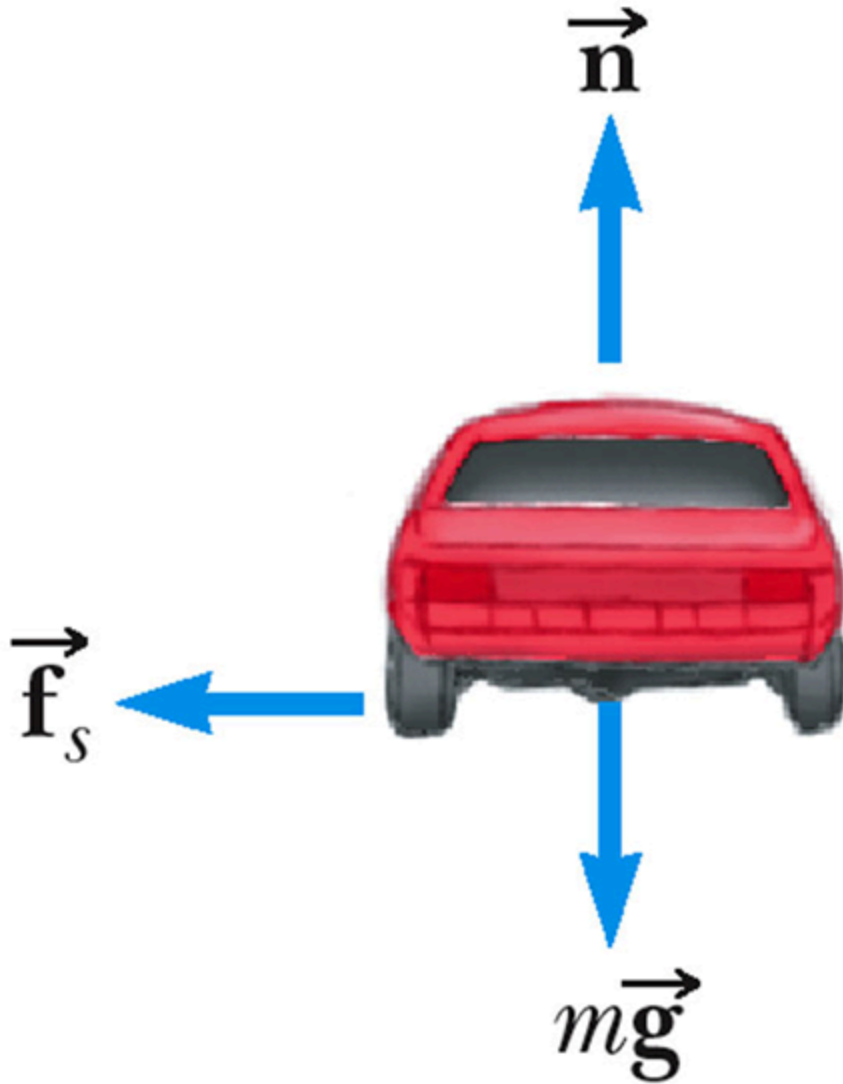

Question 2: What percentage of the initial kinetic energy is lost in the collision?

- 10. A helicopter rotor turns at 320 revs/min. How fast is that in radians per second?

- 11. A race car accelerates uniformly from a speed of 40.0 m/s to 60.0 m/s in 5.00 s around a circular track of radius 400 m. When the car reaches a speed of 50.0 m/s, find the:

- (1) Centripetal acceleration.
- (2) Angular speed.
- (3) Tangential acceleration.
- (4) The magnitude of the total acceleration.

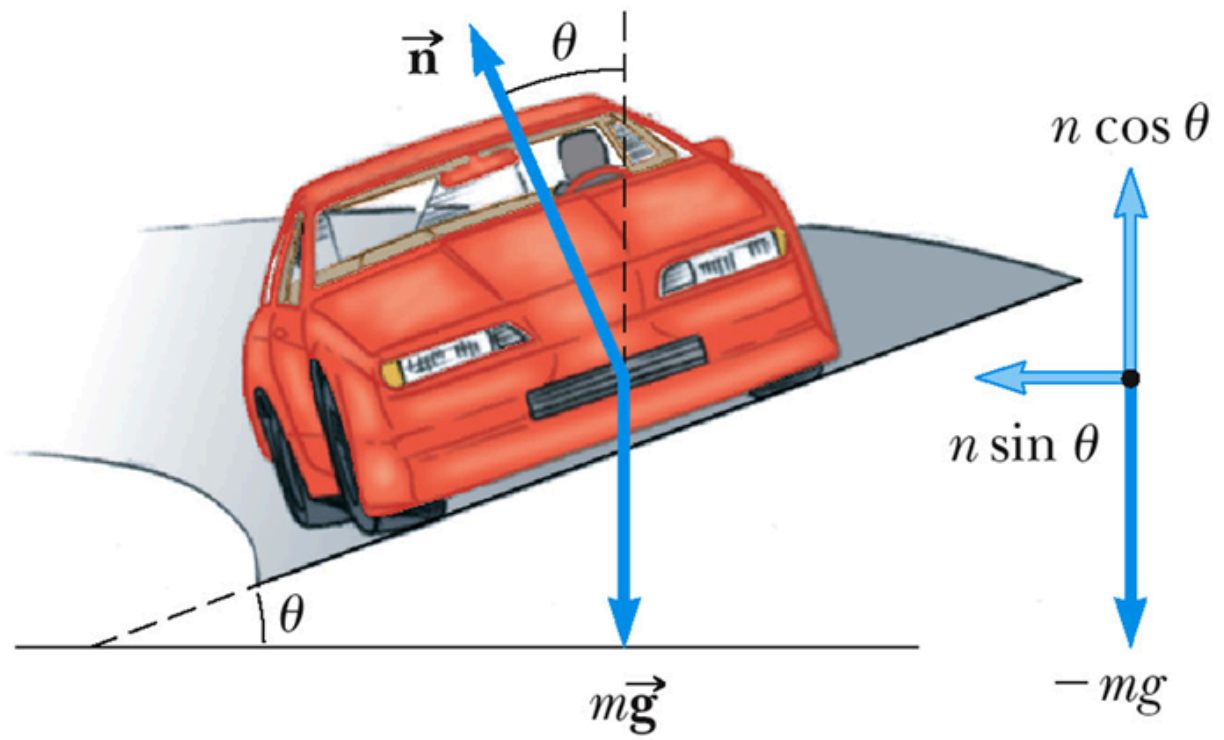

- 12. Friction is the force that produces the centripetal acceleration, r , μ , g are given, prove that $v = \sqrt{\mu rg}$.

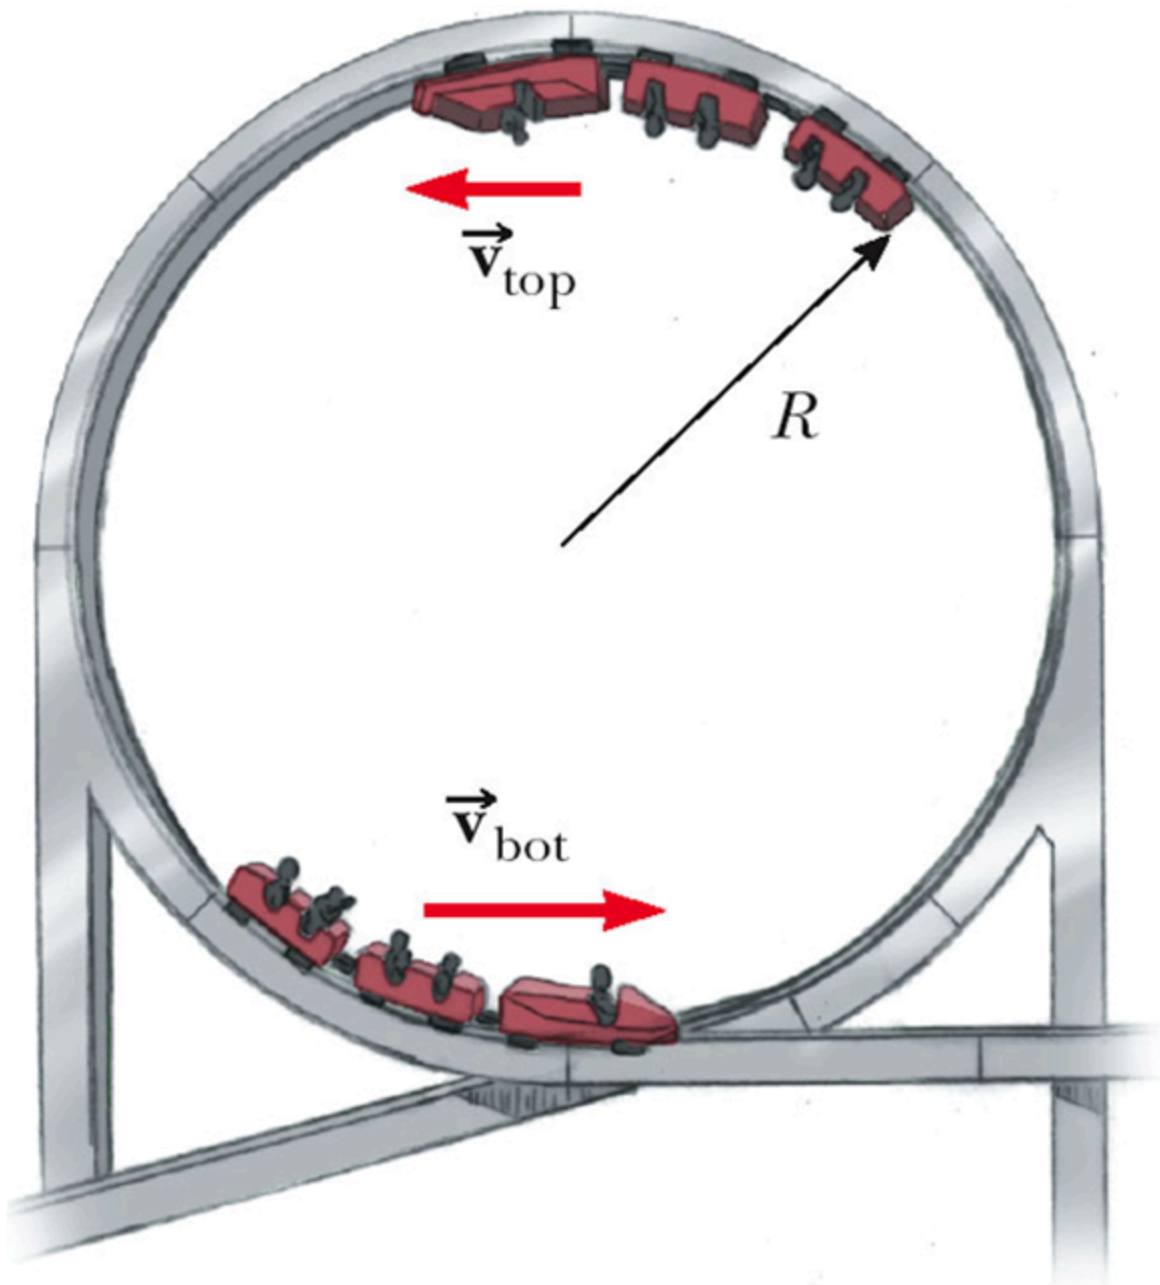

© 2006 Brooks/Cole - Thomson

- 13. A component of the normal force adds to the frictional force to allow higher speeds. In this example of circular motion sustained without friction, prove that $\tan \theta = \frac{v^2}{rg}$ (or

$$a_c = g \tan \theta).$$

14. Look at the forces at the top of the circle. The minimum speed at the top of the circle is?

© 2006 Brooks/Cole - Thomson

• 15. How to calculate the first cosmic velocity?

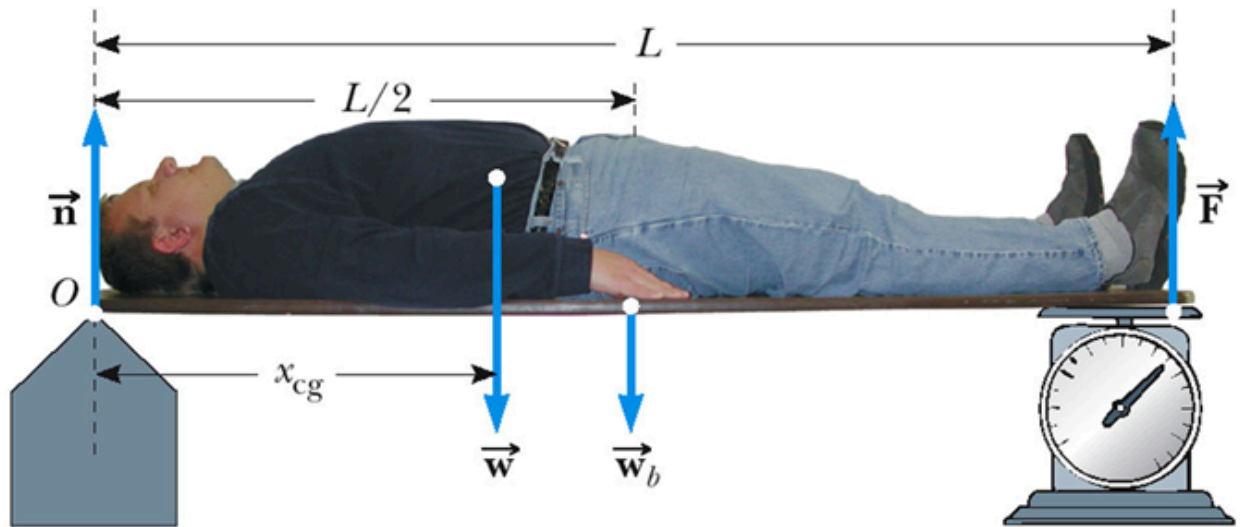

• 16. How to calculate the second cosmic velocity?

When an object escape the gravity of a planet, its potential energy and kinetic energy at infinity are both 0. $K_E + K_P = 0$.

• 17. According to Kepler's First Law, all planets move in () orbits with the Sun at (). Note for the vocabulary elliptical and focal point.

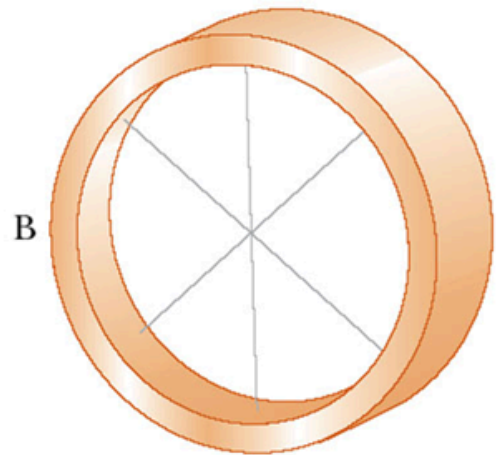

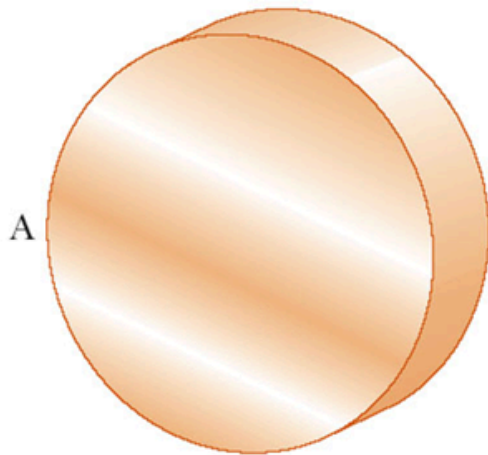

• 18. According to Kepler's Third Law, the square of the orbital period of any planet is proportional to () of the average distance from the Sun to the planet.

19. Consider a person with $L = 173 \text{ cm}$ and weight $w = 715 \text{ N}$ laying on a board with weight $w_b = 49 \text{ N}$; a scale has a force reading of $F = 350 \text{ N}$. Find the person's center of gravity.

© 2006 Brooks/Cole - Thomson

- 20. The two rigid objects have the same mass, radius, and angular speed. If the same braking torque is applied to each, which will take longer to stop? A or B? Why?

© 2006 Brooks/Cole - Thomson

$\tau = I\alpha$, since $I_A = \frac{1}{2}mr^2$ and $I_B = mr^2$, $I_A < I_B$, $\alpha_A > \alpha_B$. $t = \frac{\omega}{\alpha}$, thus $t_A < t_B$. (Note for the last equation)

•

21. When a skater is rotating on the surface of ice, with hands and feet drawn closer to the body, the skater's angular speed will increase or decrease? Why?

二、振动与波动

- 1. Simple Harmonic Motion is motion that occurs when the net force along the direction of motion obeys (). The force is () to the displacement and always directed toward the ()

position.

The third blank: **equilibrium**.

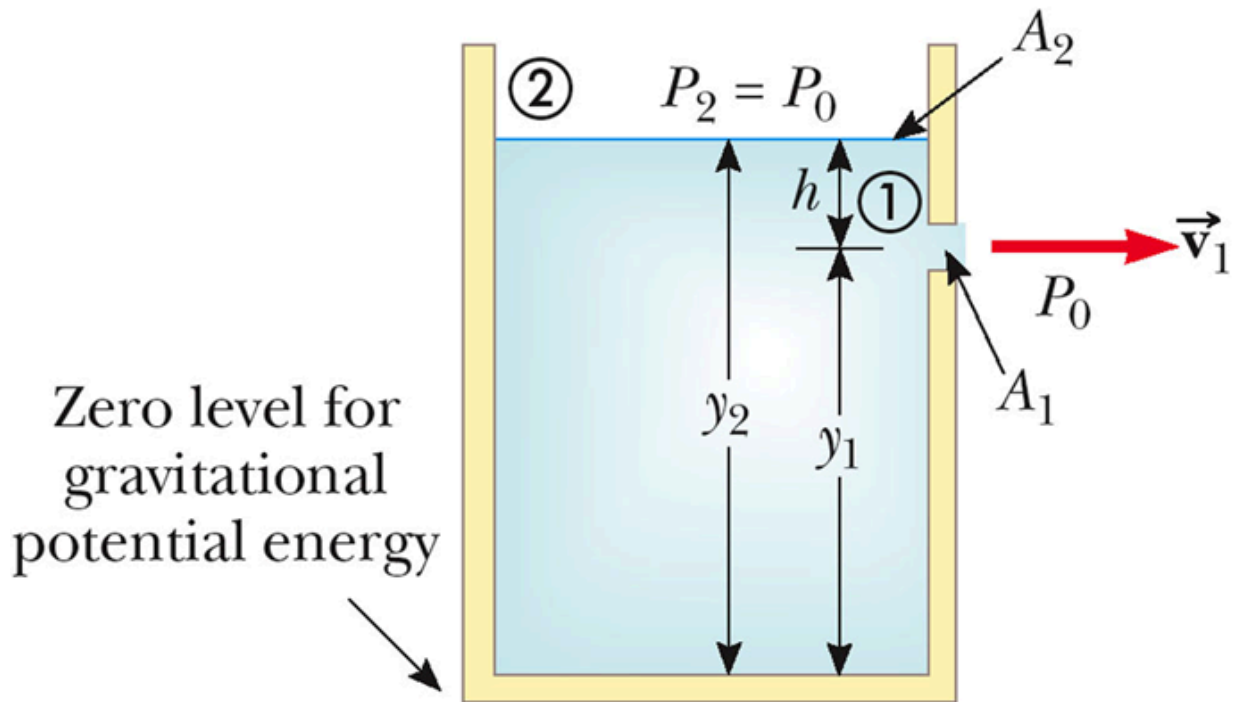

-
- 2. Right or wrong: All periodic motion over the same path are simple harmonic motion.
- 3. In general, the motion of a pendulum with big angles is not simple harmonic; only when the angles are less than (), it becomes simple harmonic.
15° on PPT.
-
- 4. What is the difference between the motion of a simple pendulum and simple harmonic motion in terms of period?
-
- 5. In a transverse wave, each element that is disturbed moves in a () direction to the wave motion.
-
- 6. In a longitudinal wave, the elements of the medium undergo displacements () to the motion of the wave.
-
- 7. If two traveling waves are moving through a medium, the resulting wave is found by () together the displacements of the individual waves point by point; when they pass through each other they will () be altered.
-
- 8. In constructive interference, if the two waves have the same frequency and amplitude, they are called in the same (). The combined wave has the () frequency and a () amplitude.
- 9. What is the difference when a traveling wave is reflected from a fixed end and from a free end?

For **fixed end**, the wave is **inverted**. For a **free end**, the pulse is **not inverted**.

三、固体、液体与气体

- 1. Describe the interactions and movement of molecules in solids, liquids and gases.
 - Solids: Molecules are held in **specific locations** and **vibrate about equilibrium positions**.
 - Liquids: Molecules **wander through** the liquid in a random fashion. But the intermolecular forces are **not strong to keep it vibrating in fixed position**.
 - Gases: Molecules are **in constant random motion**. And the molecules exert only **weak forces** on each other.
- 2. What is the difference between crystalline and amorphous solids?
In lattices structure, the crystalline solid is **long-range ordered** while the amorphous solid is **short-range ordered** but **long-range disorder**.

- 3. Explain the content of unit cell theory.
 - Every crystal has a smallest unit cell with a specific shapes.
 - Large crystals are formed by stacking numerous unit cells together.
- 4. According to the edge () of the unit cell and the () between the crystal faces, crystals are divided into seven types, usually called the seven crystal systems.
length and angle
- 5. What is the difference between strain and stress?
The strain is a measure of the amount of deformation (ratio of deformation to original size).
The stress is the force per unit area causing the deformation.
-
- 6. Draw the curve to reveal the relation of strain and stress, and label the two critical points.
two points: elastic limit and breaking point
-
- 7. The pressure at the bottom of a glass filled with water ($\rho = 1000 \text{ kg/m}^3$) is P . The water is poured out, and the glass is filled with ethyl alcohol ($\rho = 806 \text{ kg/m}^3$). Now the pressure at the bottom of the glass is.
(a) Smaller than P (b) Larger than P (c) Equal to P (d) Indeterminate
-
- 8. You buy a gold crown and want to know if it is really gold. Its weight is 7.84 N. In water, the weight is 6.86 N. Is it gold? ($\rho_{\text{gold}} = 19.3 \text{ g/cm}^3$)
-
- 9. Explain the origin of the lift force in an airplane wing with Bernoulli's Equation.
 $p + \rho gh + \frac{1}{2} \rho v^2 = \text{constant}$. Here the height can be ignored. $p + \frac{1}{2} \rho v^2 = \text{constant}$
 $v_{\text{up}} > v_{\text{down}}$, $p_{\text{up}} < p_{\text{down}}$. The pressure difference produces the lift force.
-
- 10. Consider a tank with a hole. The top is open to the atmosphere. Determine the speed at which water leaves the hole if it is 0.500 m below the water level. Where does the stream hit the ground if the hole is 3.00 m above the ground?

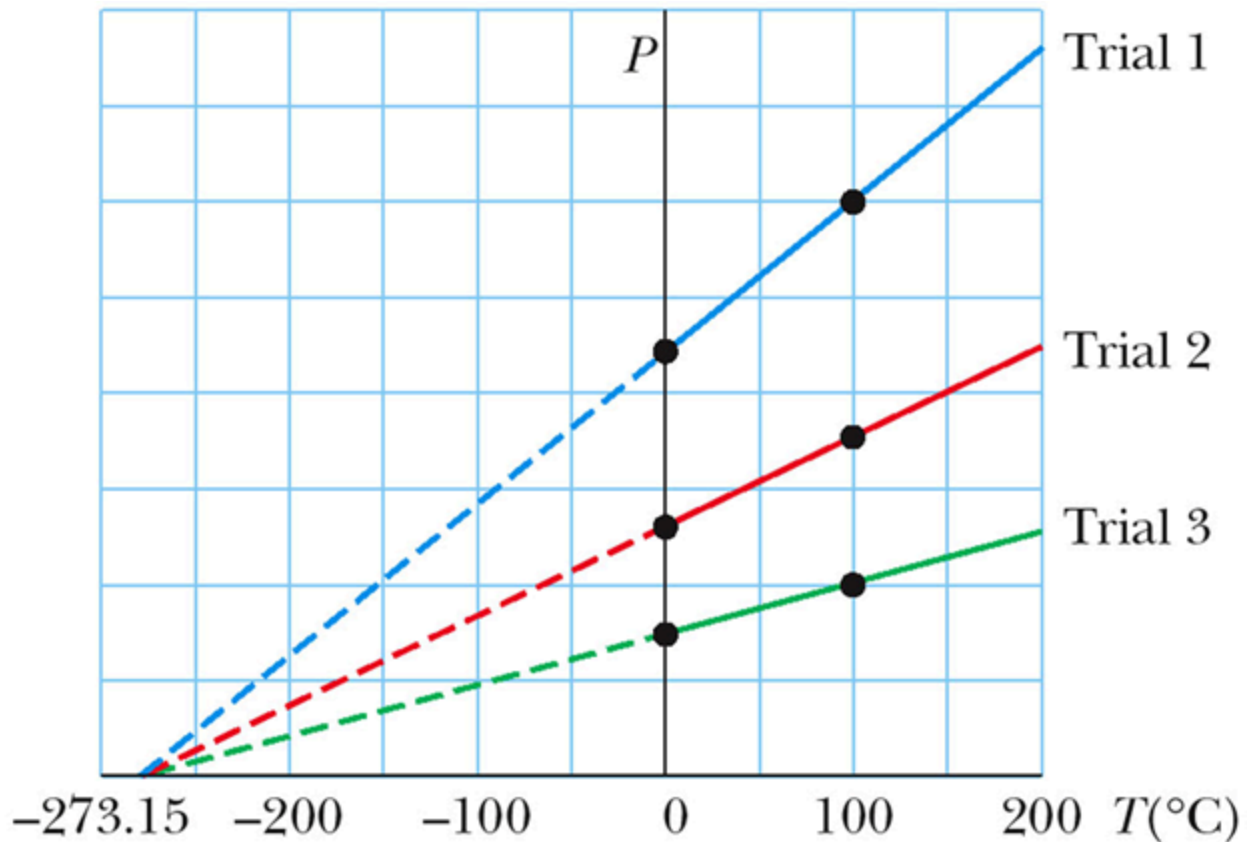

© 2006 Brooks/Cole - Thomson

note for the zero level for gravitational potential energy.

四、热学基础

-
- 1. The exchange of energy between objects because of () is called heat.
-
- 2. What is the content of the Zeroth Law of Thermodynamics?
- 3. Tell the difference between the Seebeck Effect and the Peltier Effect.
Seebeck effect is the transformation from thermal energy to electrical energy. It generate the electromotive force due to temperature difference.
Peltier effect is the transformation from electrical energy to thermal energy. When an electric current passes through a junction, a heat will be absorbed or released.
-

4. Explain why all gases extrapolate to the same temperature at zero pressure.

© 2006 Brooks/Cole - Thomson

- 5. Explain why absolute zero cannot be reached with the ideal gas state equation.
When temperature approaches absolute zero, the **intermolecular force** cannot be ignored, making the ideal gas model invalid. And for the equation, when $T \rightarrow 0$, then $P \rightarrow 0$. But actually **molecular thermal motion** cannot stop completely. And it will also cause phase transformation.
- 6. The thermal expansion of an object is a consequence of the change in the () between its constituent atoms or molecules.
average distance
- 7. Explain the origin of thermal expansion.
At ordinary temperature, molecules **vibrate with a small amplitude**. As temperature increases, the **amplitude increases**, which causes the thermal expansion.
- 8. Explain the structure of graphite.
It is **layered crystal structure**. Within layer, it exhibits characteristics of **atomic crystal**. Among layers, it exhibits characteristics of **molecular crystal**.
- 9. Determine the increase in ocean depth due to linear expansion from an increase of 1°C owing to global warming effects. Assume a current average ocean depth of $L_0 = 4000$ m and use $\alpha = 6.90 \times 10^{-5} (^{\circ}\text{C})^{-1}$.

- **10.** Explain the unusual behavior of water: As the temperature of water increases from 0°C to 4°C , it contracts and its density increases. Above 4°C , water exhibits the expected expansion with increasing temperature. The maximum density of water is 1000 kg/m^3 at 4°C .

When heated around 0°C , ice-like molecules continue to break down, forming a tighter arrangement and increasing the density. Furthermore, the thermal motion of water molecules increases, and the distance between them increases, causing the density to decrease as the temperature rises. Below 4°C , the first effect dominates while above 4°C , the second effect prevails.

- **11.** A steel strut near a ship's furnace has a mass of 1.57 kg . It absorbs thermal energy from the furnace in the amount of $2.50 \times 10^5\text{ J}$. Find its change in temperature if it has a specific heat $c = 448\text{ J/kg/}^{\circ}\text{C}$.

- **12.** Explain why: During the day, the wind blows from the sea surface to the land, while at night, the wind blows from the land to the sea surface.
Water has a higher specific heat than land's. Thus during the day, the air above the land warms faster while cools faster during night. So the wind blows from the sea surface to the land during the day and from the land to the sea surface at night.

- **13.** A 125 g block of unknown substance with $T = 90^{\circ}\text{C}$ is placed in a calorimeter containing 0.326 kg of water at 20°C . The system achieves an equilibrium temperature of 22.4°C . Find the specific heat c for the unknown substance. Note that the specific heat of water is $c_w = 4190\text{ J/kg/}^{\circ}\text{C}$.

- **14.** Phase changes involve a change in the () but no change in ().
internal energy and temperature

- **15.** 6 kg of ice at -5°C is added to 30 liters of water at 20°C . What is the temperature of the water when it comes to equilibrium?

- **16.** Explain sublimation in terms of intermolecular forces.

In solid state, the intermolecular forces between molecules are strong. When temperature increases, these interaction weaken, allowing the molecules to gain enough energy to overcome their mutual constraints and transition directly from solid to gas.

- **17.** Explain sublimation in terms of thermodynamic equilibrium.

At a certain temperature and pressure, a substance reaches thermodynamic equilibrium between different phases. The chemical potential difference between the solid and the gas phases is not sufficiently large for sublimation.

18. A copper slug whose mass m_c is 75 g is heated in a laboratory oven to a temperature T of 312°C. The slug is then dropped into a glass beaker containing a mass $m_w = 220$ g of water. The heat capacity C_b of the beaker is 45 cal/K. The initial temperature T_i of the water and the beaker is 12°C. Assuming that the slug, beaker, and water are an isolated system and the water does not vaporize, find the final temperature T_f of the system at thermal equilibrium.

$$Q_c = c_c m_c (T_f - T), Q_b = C_b (T_f - T_i), Q_w = c_w m_w (T_f - T_i), Q_c + Q_b + Q_w = 0$$

五、热力学定律

-
- 1. Thermodynamics is the study of heat and its relationship to (), () and matter.
- 2. What is the nature of Heat (Q) and Work (W)?
Heat is the **transfer of energy** due to a **temperature difference** while work is the **transfer of energy** due to a **force** acting through a distance.
-
- 3. The First Law of Thermodynamics asserts that energy cannot be () or () in an isolated system; it can only be transformed from one () to another or transferred between systems.
- 4. How to understand that the First Law of Thermodynamics provides a connection between microscopic and macroscopic worlds?
The internal energy is the sum of molecular potential energy and kinetic energy due to **random molecular collisions** in the **microscopic** system while work and heat is the **transfer of energy** by applying force on displacement and temperature difference in the **macroscopic system**.
-
- 5. An ideal gas absorbs 5000 J of energy while doing 2000 J of work on the environment during a constant pressure process.
(a) Compute the change in internal energy of the gas.
(b) If the internal energy drops by 4500 J and 2000 J is expelled from the system, find the change in volume assuming a constant pressure at 1.01×10^5 Pa .
-
- 6. Let 1.00 kg of liquid water at 100°C be converted to steam at 100°C by boiling at standard atmospheric pressure (which is 1.00 atm or 1.01×10^5 Pa). The volume of that water changes from an initial value of $1.00 \times 10^{-3} \text{ m}^3$ as a liquid to 1.671 m^3 as steam.
(a) How much work is done by the system during this process?
(b) How much energy is transferred as heat during the process?
(c) What is the change in the system's internal energy during the process?
-

7. According to the Second Law of Thermodynamics, heat cannot () transfer from a lower temperature body to a higher temperature body. It is () to extract heat from a single source and convert it completely into useful work without causing other side effects.

8. The Second Law of Thermodynamics is a fundamental principle that governs the () of natural processes and the behavior of energy within systems.

9. Entropy is a measure of () or randomness in a system. The Second Law asserts that the total entropy of an isolated system tends to () over time.

disorder and increase

10. Methods of Heat Transfer include (), () and ().

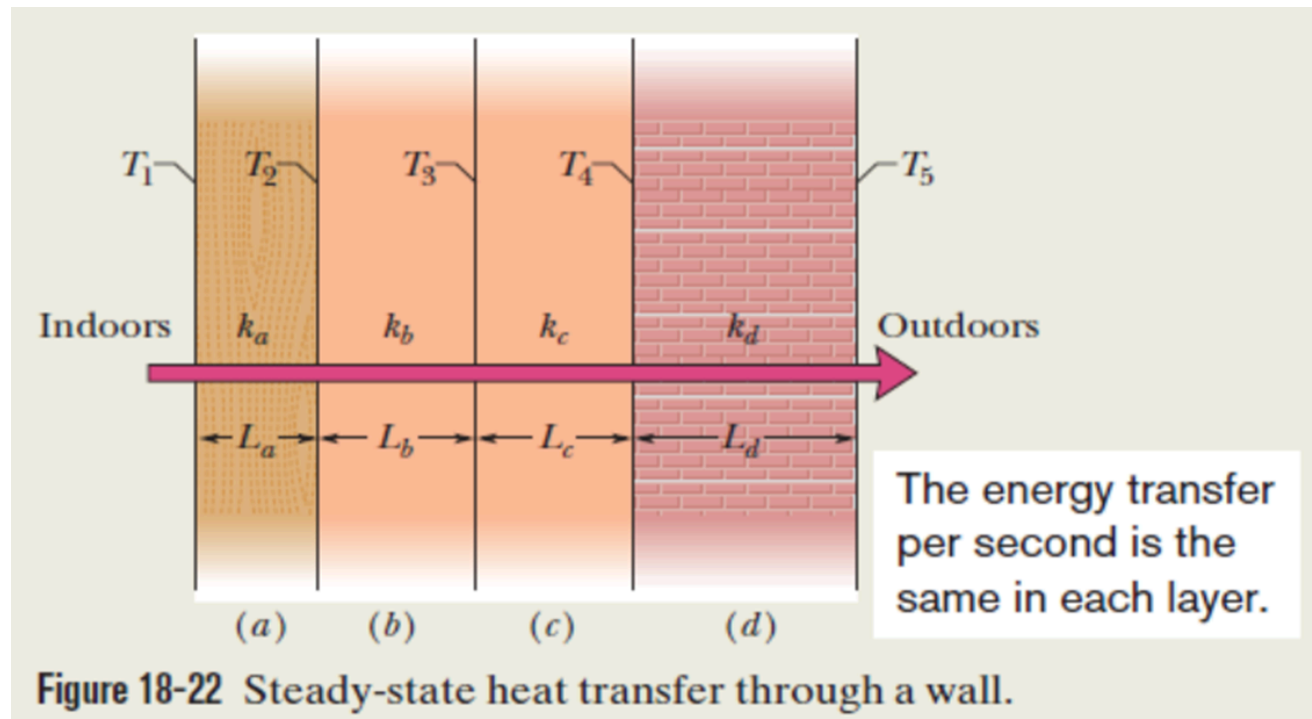

Note for convection.

11. Explain the reason causing conduction of heat, and why metals are good conductors?

It is an exchange of energy between microscopic particles by collisions. Less energetic particles gain energy during collisions with more energetic particles.

Metal contain large number of free electrons and they can transport energy from one region to another.

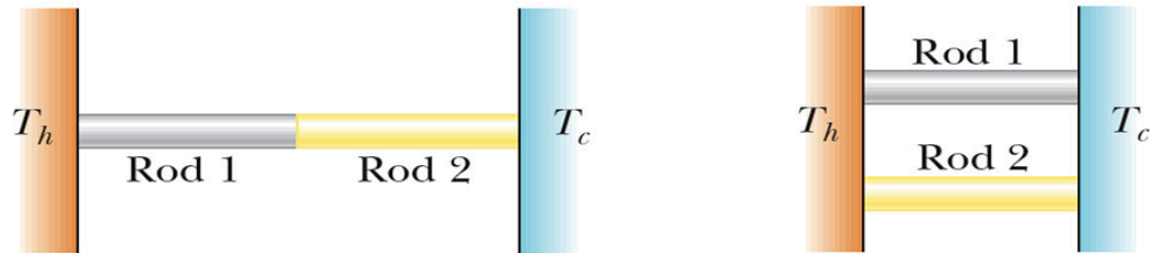

12. Figure shows the cross section of a wall made of white pine of thickness L_a and brick of thickness $L_d (= 2.0L_a)$, sandwiching two layers of unknown material with identical thicknesses and thermal conductivities. The thermal conductivity of the pine is k_a and that of the brick is $k_d (= 5.0k_a)$. The face area A of the wall is unknown. Thermal conduction through the wall has reached the steady state; the only known interface temperatures are $T_1 = 25^\circ\text{C}$, $T_2 = 20^\circ\text{C}$ and $T_5 = -10^\circ\text{C}$. What is the interface temperature T_4 ?

Note the formula $P_{\text{cond}} = \frac{Q}{t} = k \frac{A\Delta T}{L}$.

-
- 13. Two rods of the same length and diameter are made from different materials. The rods are connected between two hot and cold regions as shown (series and parallel). In which case is the heat transfer rate larger?

1. Series 2. Parallel 3. Rate is same for both cases

© 2006 Brooks/Cole - Thomson

Similar to resistance in circuit. $R = \frac{L}{kA}$, $\Delta T \leftrightarrow U$, $P_{\text{cond}} \leftrightarrow I$

-
- 14. An ideal absorber is defined as an object that absorbs all the energy incident on it. This type of object is called a ().

-
- 15. A cylinder contains 12 L of oxygen at 20°C and 15 atm. The temperature is raised to 35°C, and the volume is reduced to 8.5 L. What is the final pressure of the gas in atmospheres? Assume that the gas is ideal.

-
- 16. One container is filled with argon gas and another with helium gas. Both are at the same temperature. Which atoms have the higher rms speed?

1. Argon 2. Helium 3. Same speed 4. Cannot tell

$$v_{\text{rms}} = \sqrt{\frac{3RT}{M}}$$

六、热力学进阶

-
- 1. A bubble of 5.00 mol of helium is submerged at a certain depth in liquid water when the water (and thus the helium) undergoes a temperature increase ΔT of 20.0°C at constant pressure. As a result, the bubble expands. The helium is monatomic and ideal.
 - How much energy is added to the helium as heat during the increase and expansion?
 - What is the change in the internal energy of the helium during the temperature increase?
 - How much work W is done by the helium as it expands against the pressure of the surrounding water during the temperature increase?

- $Q = nC_p\Delta T$

- $\Delta U = nC_V\Delta T$

- $W = Q - \Delta U$

2. Initially, 1 mol of oxygen (assumed to be an ideal gas) has a temperature of 310 K and a volume of 12 L. We will allow it to expand to a volume of 19 L.

(a) What would be the final temperature if the gas expands adiabatically? Oxygen (O_2) is diatomic and here has rotation but no oscillation.

(b) What would be the final temperature and pressure if, instead, the gas expands freely to the new volume, from an initial pressure of 2.0 Pa?

- $T_i V_i^{\gamma-1} = T_f V_f^{\gamma-1}$, $\gamma = \frac{C_p}{C_V}$, $C_V = \frac{5}{2}R$ for diatomic.

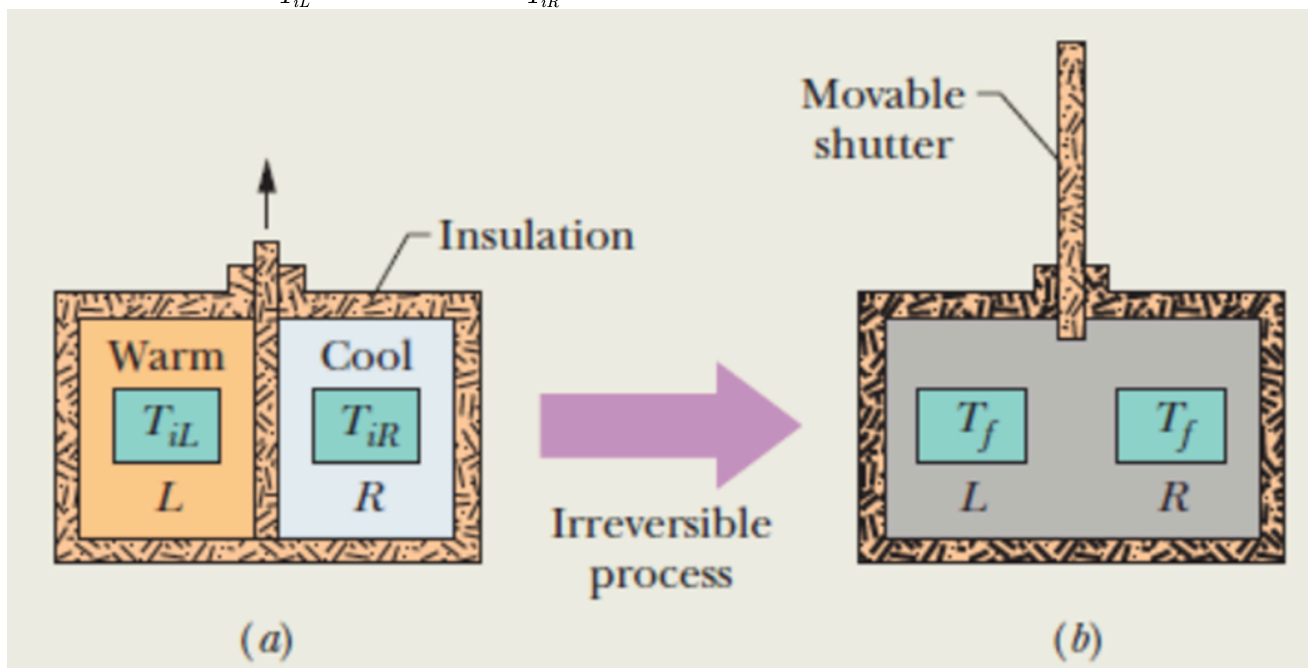

- $p_i V_i = p_f V_f$.

- 3. Figure shows two identical copper blocks of mass $m = 1.5$ kg : block L at temperature $T_{iL} = 60^\circ C$ and block R at temperature $T_{iR} = 20^\circ C$. The blocks are in a thermally insulated box and are separated by an insulating shutter. When we lift the shutter, the blocks eventually come to the equilibrium temperature $T_f = 40^\circ C$. What is the net entropy change of the two-block system during this irreversible process? The specific heat of copper is 386 J/kg·K.

Note that only **reversible isothermal process** can use $\Delta S = \frac{Q}{T}$ rather than $\Delta S = \int \frac{1}{T} dQ$.

$$dQ = cm dT, \Delta S = \int \frac{1}{T} dQ = cm \int_{T_i}^{T_f} \frac{dT}{T} = cm \ln \frac{T_f}{T_i}.$$

$$\text{Thus } \Delta S_L = cm \ln \frac{T_f}{T_{iL}}, \Delta S_R = cm \ln \frac{T_f}{T_{iR}}, \Delta S = \Delta S_L + \Delta S_R.$$

- 4. Suppose 1.0 mol of nitrogen gas is confined to the left side of the container. You open the stopcock, and the volume of the gas doubles. What is the entropy change of the gas for this irreversible process? Treat the gas as ideal.

$$S = \frac{Q}{T}, Q = W = nRT \ln \frac{V_f}{V_i}, V_f = 2V_i$$

5. What are the four processes of a Carnot Cycle?

- Isothermal expansion
- Adiabatic expansion
- Isothermal compression
- Adiabatic compression

6. How to determine the net work of a Carnot Cycle?

The area of $p - V$ graph enclosed by the cycle curve.

7. What is the difference between the Stirling engine and the Carnot engine? Please draw the P-V plot to show the above difference.

Stirling engine modifies the two adiabatic processes into **constant-volume** processes.

- 8. Imagine a Carnot engine that operates between the temperatures $T_H = 850\text{ K}$ and $T_L = 300\text{ K}$. The engine performs 1200 J of work each cycle, which takes 0.25 s.

(a) What is the efficiency of this engine?

(b) What is the average power of this engine?

(c) How much energy $|Q_H|$ is extracted as heat from the high-temperature reservoir every cycle?

(d) How much energy $|Q_L|$ is delivered as heat to the low-temperature reservoir every cycle?

(e) By how much does the entropy of the working substance change as a result of the energy transferred to it from the high-temperature reservoir? From it to the low-temperature reservoir?

- $|Q_H| = \frac{W}{\epsilon}$
- $Q = |Q_H| - |Q_L|, \Delta U = Q - W = 0$
- $\Delta S_H = \frac{|Q_H|}{T_H}, \Delta S_L = -\frac{|Q_L|}{T_L}, \Delta S = \Delta S_H + \Delta S_L = 0,$

- 9. A refrigerator is a device that uses () in order to transfer energy from a low-temperature reservoir to a high-temperature reservoir.

work

- 10. A refrigerator that did not require some input of work is a perfect refrigerator that transfers energy as heat Q from a cold reservoir to a warm reservoir without the need for work. How to verify that there does not exist the perfect refrigerator?

The net entropy change of the entire system is $\Delta S = -\frac{|Q|}{T_L} + \frac{|Q|}{T_H}$. Since $T_H > T_L$, $\Delta S < 0$, which is impossible for a isolated system.

七、原子物理与半导体

- 1. In order to explain the () experiments, Rutherford proposed his atomic structure.

- 2. What are the difficulties with the Rutherford Model of atomic structure?
 - Unable to explain the discrete characteristic frequencies of electromagnetic radiation.
 - Unable to explain the electrons can stably undergo a centripetal acceleration rather than radiate electromagnetic waves to lose energy until it spiral into the nucleus.
- 3. The Bohr Theory of Hydrogen includes both () and non-classical ideas.
- 4. In Bohr's Assumptions for Hydrogen, the electron moves in circular orbits around the proton under the influence of the () force of attraction, which produces the centripetal acceleration.
Coulomb
- 5. In order to explain the () in Atomic Scattering Experiments, Sommerfeld improved Bohr's atomic structure.
fine structure
- 6. The Zeeman effect is the splitting of spectral lines in ().
strong magnetic field
- 7. When a metal target is bombarded by high-energy (), x-rays are emitted.
- 8. List out at least two substances emitted when a metal target is bombarded by X-ray. List out at least two substances emitted when a metal target is bombarded by high-energy electrons.
 - Photoelectron, Auger Electron
 - X-rays, secondary electron
- 9. Explain the mechanism of Characteristic X-Rays.
 - A bombarding electrons collides with an electron in target metal that is in an inner shell and remove it to form a vacancy.
 - The electron from a higher energy level falls into the vacancy and the transition emits a photon whose energy is equal to the difference between two levels.
- 10. An atom may have many possible energy levels. At ordinary temperatures, most of the atoms in a sample are in the ground state. Only photons with energies corresponding to () can be absorbed.
energy difference between two energy level
- 11. Once an atom is in an excited state, there is a constant probability that it will jump back to a lower state by emitting a ().
- 12. () is the prerequisite for laser generation.
population inversion

- 13. The () and the () population of the highest bands determines whether the solid is a conductor, an insulator, or a semiconductor.
separation and electron
- 14. The valence band is the () band. The () band is the next higher empty band.
 - highest filled
 - conduction band
- 15. Explain why conductors are easy to conduct electrons.
It takes very little energy for electrons to jump from the partially filled to one of nearby empty places.
- 16. Explain why insulators are difficult to conduct electrons.
The valence band is completely full of electrons while conduction band is empty. A large band gap exists between valence band and conduction band, which needs a large amount of energy to jump from the valence band to conduction band.
- 17. Why does the resistivity of semiconductors decrease with increases in temperature?
Thermally excited electrons have enough energy to cross the band gap. Thus its resistivity decreases with increases in temperature.
- 18. What is an n-type Semiconductor?
Donor atoms are doping materials that contain one more electrons than semiconductor material, which creates free electrons.
- 19. What is a p-type Semiconductor?
Acceptor atoms are doping materials that contain one less electron than semiconductor material, which leaves holes.
- 20. What is the depletion region?
The depletion region is a region in a p-n junction where donor electrons diffuse from n side to p side and holes diffuse from p side to n side and resulting depleted of mobile charge carriers.
- 21. The p-n junction has the ability to pass current in () direction.
only one
